

## ABSTRACT OF THE INVENTION

An air filter-shaping mold includes an upper and a lower mold base combined together. The upper and the  
5 lower mold base are respectively formed with plural curved separating plates. A filter material having the same shape as the separating plates is placed on the separating plates of the lower mold base for carrying out forming of an air filter, able to save labor and time in  
10 making molds and cost on material, to position the filter material precisely, to elevate production efficiency and to stabilize quality of products.
